Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject, and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cardiac ankyrin repeat kinase/fucose-1-phosphate guanylyltransferase, CARK/FPGT, proximal probe.

                                          melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting t presence or absence of one or more polymorphic variations associated we melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the presence acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The preventative reduces ultraviolet (UV) light exposure to the subject. The preventating melanoma. The present sequence represents a human cyclin-dependent kinase 10, CDK10, proximal SNP pro

The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nuclaic acid samplerom a subject. Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and mple the with

                                                                                                                                                       The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single more polymorphisms within human glycoprotein VI (platelet) (GP6;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          compositions are useful for treating melanoma. The present sequence represents a human cardiac ankyrin repeat kinase/fucose-1-phosphate guanylyltransferase, CARK/FPGT, proximal probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           breast cancer; cyt

                                                                                                                                                                                                                                                                                                                                                                                                    for detecting methylation of promoter CpG islands occurring in multiple genes. The present invention describes using oligonucleotide primers to determine the position of a target gene and promoter CpG islands, this constitutes treating DNA of the target gene with sodium bisulfite in order to carry out methylation specific (MSP) PCR or multiplex MSP PCR to amplify the sodium bisulfite treated DNA and sequencing the PCR product to confirm the hypomethylation site of the promoter CpG islands of multiple genes. Accordingly, the chip comprises primer sequences designed from these PCR products that have amine linkers of 12 carbons attached to the 5'-terminal, which are spotted onto the glass slide coated with 3-aminopropyltrimethoxylan and 1,4-dissothocyanate using an array robot. The resulting minisequencing chip is useful for detecting cancer, thereby accurately and rapidly detecting methylation of CpG islands of multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Minisequencing type oligonucleotide chip for detecting methylation of promoter CpG islands of multiple genes, useful for detecting cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mini-sequencing; CpG island; methylation specific PCR; MSP; multiplex MSP PCR; cancer; PCR; primer; ss; microarray chip
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09-SEP-2004 (first entry)

                                                                                                                                                                                                                                                                                                                                           Crimer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC identity of a SNP and for genotyping nucleic acid sample by clidentity of a SNP and for genotyping nucleic acid samples, for e.g. to consider the presence, absence or cc identity of a SNP and for genotyping nucleic acid samples, for e.g. to cidentity of a SNP and for genotyping nucleic acid samples, for e.g. to casses by association analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic traits usepected of being caused by one or more SNPs. Phenotypic traits usepected of being consummaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cdystrophy, familial hypercholesterolaemia, polycystic kidney diseases, cc osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial cc diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and cc paternity analysis. The present someoners represents a DCP primer specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides nucleotides encoding molecular variants the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which called to difficulties in treating cancer, cardiovascular, neuronal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-JUL-1999; 99EP-00114938

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, sestric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine oxidase), polypoptide 5 (CYP3A5) polymorlectide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides nucleotides encoding molecular vari the human multi drug resistance-1 (MDR-1) protein. These can be us identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, whi lead to difficulties in treating cancer, cardiovascular, neuronal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (MDR) -1 pol
associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Brinkmann
                                                                                                                                                   New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide

       CC derivative for the preparation of a pharmacoutical composition for cc treating colorectal, cervical, gastric, lung, ovarian or pancreatic cc cancer, or malignant glioma in a subject having a genome with a variant cc cd allele which comprises a cytochrome p450, subfamily IIIA (nifedipine cc oxidase), polypeptide 5 (CYP9A5) polymucleotide (II). (I) and (II) have cc cytostatic activity. The therapeutic applications of (II) is improved, cc since it is possible to individually treat a subject with an appropriate cc dosage and/or an appropriate derivative of (I). Therefore, undesirable, cc harmful or toxic effects are efficiently avoided. Unnecessary and constraint with substances (nonresponders), as well as the development of chug resistances due to suboptimal drug dosing can be avoided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    since it is possible to individually treat a subject with an appropriational dosage and/or an appropriate derivative of (I). Therefore, undesirable harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to treatment with substances (nonresponders), as well as the development drug resistances due to suboptimal drug dosing can be avoided. ACF6220 to ACF62751 and ABM34912 to ABM35013 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                  New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                       23-JUL-2001;

                                                                                                                                                                                                                                                The present invention describes a method for the use of irinotecan (I) of the derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein I (MRPI) polymucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represent a sequence which is used in the exemplification of the present inventior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        irinotecan; colorectal cancer; cervical cancer; gastric cancer;

This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            colorectal cancer; cervical cancer; gastric cancer; lung ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member Al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23-JUL-2001; 2001EP-00117608

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                           irinotecan; colorectal cancer; cervical cancer; q

A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    multidrug resist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 19
The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal,
                                                                                                                                                                                                                                                                                New use of irinotecan for preparation of treating cancer in subject having genome multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-JUL-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of a late-onset neurodegenerative disease to a patient which comprises analysing a sample from the patient to determine whether the patient has a Damino acid oxidase (DAO) abnormality, where the presence of a DAO abnormality is an indication that the patient has an increased risk of the late-onset neurodegenerative disease. DAO is a flavin dinucleotide (FAD)-dependent oxidase which catalyses the oxidative deamination of Damino acids (EC.1.4.3.3). The method of the invention has neuroprotective and antiparkinsonian applications and may be useful in determining an increased risk of a late-onset neurodegenerative disease to a patient, as well as in preparing a medicament for treating a late-onset neurodegenerative disease.

(I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAI73060 to AAI79867 represent isolated human polymorphic polymucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. Treventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cyclin-dependent kinase 10, CDK10, proximal SNP probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a subject at risk of melanoma, useful for treating mecomprises detecting the presence or absence of one or more polymovariations associated with melanoma in a nucleic acid sample from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of identifying a subject at rimelanoma comprising detecting the presence or absence of one or polymorphic variations associated with melanoma in a nucleic aci

nucleic acids encoding it (ABZ57108). The protein has a molecular weight of 10 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. KIAAA608 protein 10.12 can be used in the treatment of a variety of diseases such as peptic ulcers and diabetes. Sequences ABZ57113-ABZ57114 represent human KIAAA608 protein 10.12 probes used in an exemplification of the

The invention relates to human KIAA0608 protein 10.12 (ABP58674) and nucleic acids encoding it (ABZ57108). The protein has a molecular we

                                            CC sequences (1), which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM5329 represent peptides related to human polymorphic polymorphic polymorphic polymorphic polymorphic polymorphic polymorphy, and in vaccine production. (1) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For CC example, (1) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides by expression of polypeptides. Additionally, (1) and its complementary cCC sequences may also be used as NAM probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CCC untibodies may be in need of restorative therapy. The CCC antibodies may be in need of restorative therapy. The CCC antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic constraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                              CC sequences (1), which contain single nucleotide polymorphic polynucleotide sequences (1), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (1) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (1) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (1) and its complementary csequences may also be used as NAM probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be used as antigens in the production of polypeptides expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides.

                                                                                                                                                                                          The present invention relates to oligonucleotides encoding polymorphic cc variants of proteins related to amylases, amyloid proteins, angiopoietin, cc apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, chistones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinasins, cytokines, interferons, interfeukins, Grotein coupled receptors and thioesterases. The present sequence is one cc such oligonucleotide. The oligonucleotides and the peptides encoded by ct them may be used in the prevention, diagnosis and treatment of diseases cc associated with inappropriate expression of the proteins listed above. Clisorders that may be prevented, diagnosed and/or treated include cultifactorial diseases with a genetic component, such as autoimmune cc systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, carceric corporations), diseases of the nervous system and an infection of pathogenic creations.
                                                                        Matches
                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating fact; complement related protein; cytochrome; kinesin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection; nervous system disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAL27794 standard; DNA; 51

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC polynicalectide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat discretes by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides or CC by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of CC polypeptides encoded by (I) may be used as antigens in the production of constitution constitution of con
                                                                                                                                                                                                                                                                                                                           Query Match

Ribozymes having modified bases and in inhibiting disease related genes. methods for producing them 1 for use

Claim 2; Page 175; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders.                                                                                                                                    Matches
                                                                                                                                                                                                                           AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of isolated gene transcripts - useful for developing products diagnosis, prognosis and treatment of cancers, particularly colon pancreatic cancer.

                                                                                                                                                                                                                                                                                                          The present invention describes an isolated polynucleotide (I) comprising CC a nucleotide sequence (S) which is a polymorphic variant of a reference CC sequence for the human immunoglobulin E receptor I alpha subunit (IGERA) CC gene or its fragment. The polymorphic variant comprises at least one CC polymorphism selected from guanine (G) at polymorphic site (PS) 1, PS9, PS10 or PS21, cytosine (C) at PS2, PS3, PS6, PS12, PS18 or PS20, adenine (C) At PS8, PS16 or PS17, or (G) at a position corresponding to nucleotide CC 251, (A) at a position corresponding to nucleotide S30. (I) can be used in gene CC therapy. (I) is useful for therapeutic purposes. A polypeptide (II) CC encoded by (I) is useful in drug screening assays and in assays to measure the binding affinity of one or more candidate drugs targeting CC (II). An antibody (III) to (II) is useful to immunoprecipitate (II) from CC solution and also reacts with (II) on Western or immunoblots of CC useful in immunoassays to detect (II) in biological samples. AAP97955 to CC AAP98040 represent IGERA gene polymorphism detection primers; and CC AAP98140 represent IGERA gene polymorphism detection primers; and CC AAP98141 to AAP98180 represent IGERA gene PCR primers which are used in CC the exemplification of the present invention
                                                                                                                                                                                     Ś
                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated polynucleotide (I) comprising a nucleotide sequence (S) which is a polymorphic variant of a reference sequence for the human immunoglobulin E receptor I alpha subunit (IGERA) gene or its fragment. The polymorphic variant comprises at least one polymorphism selected from guanine (G) at polymorphic site (PS) 1, PS9, PS10 or PS21, Cytosine (C) at PS2, PS3, PS6, PS12, PS18 or PS20, adenine (G) at pS5, PS7, PS11, PS13, PS14, PS15, PS19, or PS22 and thymine (T) at PS4, PS8, PS16 or PS17, or (G) at a position corresponding to nucleotide 302 or 741, and (T) at position corresponding to nucleotide 530. (I) can be used in gene cancoded by (I) is useful for therapeutic purposes. A polypeptide (II) measure the binding affinity of one or more candidate drugs targeting (II). An antibody (III) to (II) is useful to immunoprecipitate (II) from solution and also reacts with (II) on Western or immunoblots of useful in immunoassays to detect (II) in biological samples. AAF97965 to AAF98040 represent IGERA gene polymorphism detection primers; and CC AAF98141 to AAF98180 represent IGERA gene PCR primers which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated polynucleotide (I) comprising CC a nucleotide sequence (S) which is a polymorphic variant of a reference CC sequence for the human immunoglobulin E receptor I alpha subunit (IGERA) CC gene or its fragment. The polymorphic variant comprises at least one CC polymorphism selected from guanine (G) at polymorphic site (PS) 1, PS) (CC PS10 or PS21, cytosine (C) at PS2, PS3, PS6, PS12, PS18 or PS20, adenine CC (A) at PS5, PS7, PS11, PS13, PS14, PS15, PS19, or PS22 and thymine (T) at CC PS4, PS8, PS16 or PS17, or (G) at a position corresponding to nucleotide 302 or 741, and (T) at CC a position corresponding to nucleotide 530. (I) can be used in gene CC encoded by (I) is useful for therapeutic purposes. A polypeptide (II) CC encoded by (I) is useful in drug screening assays and in assays to comeasure the binding affinity of one or more candidate drugs targeting CC (II). An antibody (III) to (II) is useful to immunoprecipitate (II) from CC suseful in immunoassays to detect (II) in biological samples. AAF9995 to AAF99096 represent IGERA gene polymorphism detection primers; and CC AAF99140 represent IGERA gene polymorphism detection primers. AAF98097 to AAF99141 to AAF98180 represent IGERA gene PCR primers which are used in CC the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                       Matches

Polymorleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The
                                                                                                                                                                                                                                                                                                                                                                                            Human;

optineurin promoter to New nucleic acid sequences of the optineurin gene are useful to polymorphisms particularly single nucleotide polymorphisms in the diagnose, prognose and treat glaucoma detect

Claim 11; SEQ ID NO 361; 159pp; English

The invention relates to an isolated nucleic acid (N1) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineur promoter appearing as ADE13890. Also included are the optineurin promot operably linked to a heterologous nucleic acid, a nucleic acid capable detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing the promoter operably linked to a heterologous sequence, diagnosing of plaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphi in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing comprising detecting a polymorphism gene, associated with a glaucoma optineurin in promoter capable of

The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The
The invention relates to an isolated nucleic acid (N1) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; optineurin; ds; ophthalmological; single nucleotide polymorphism; SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regulatory region.
                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid sequences of the optineurin gene are useful to compolymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor,

disease, autoimmune disease and infectious

is derived

sequence

treatment

inflammatory

Disclosure; Page 18; 77pp; English.

invention relates to a neural thread

neural thread protein (NTP)
Thought to be cytostatic,

cell death peptide.

The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                mRNAs, amplifying the released tags, concatenating form concatenated tags, amplifying and isolating The present sequence is human tandem tag DNA
                                                                                                                                                                                                                        Generating five prime biased tandem tag libraries of cDNAs by isolating sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the

                       Comprising 5-50 probes), contracting the sample with the one or more comprising 5-50 probes), contracting the sample with the one or more concluded acid of the sample by determining the hybridization of the one or communication acid of the sample by determining the hybridization of the one or communication acid of the sample. The genomic nucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a common of the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The grobe is also useful in comparing a sample of genomic nucleic acid with the method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array with treated mixture of sample and control genomic nucleic acid and the array to contacting the array with treated mixture of sample and control genomic conditions, concluding the signals from the differential labels of the array to that caused by hybridization of the probe under suitable hybridization conditions, and comparing the sample as compared with the relative copy numbers of sequences in the control. The hybridization of the genomic condition of the genomic nucleic acid with detectable moleic acid/mucleic acid hybrid. The sample as compared with the relative copy numbers of substantially consistence, and the from the detectable moleic acid/mucleic acid hybrid. The sample as conditions of the detectable moleic acid/mucleic acid hybrid. The sample acid are labelled with detectable moleicy such that hybridization of the genomic of the detectable and the reference of amount or location of the detectable moleic acid that is prepared from the one or more genomic array to the control acid that is prepared from a sample of genomic array comprises nucleic acid that is prepared from the one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.

         The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The method comprises treating a sample of genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, and comparing the intensities of the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The hybridization of the genomic array is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic arrays. The genomic array comprises nucleic acid that is prepared from Bacterial Artificial Chromosome (BAC) clones. The present sequence represents a non-nucleotide probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid that modulates expression of the vanilloid receptor-1, useful for control of pain or sensitivity disorders, comprises sequence from control regions of the receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pain transmission; primary sensory neuron; transcription factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
```

segment having at least one region that modulates expression of the VR1 (vanilloid receptor type 1) receptor, or a functional derivative, allele or fragment of this region, or a sequence that hybridises to it under standard conditions. The VR1 modulator is derived from one or more of positions 221931-22334 of GenBank AL670399, 31673-36359 of AL63116, or 44731-43231 or 36616-33151 of AP168787 and is involved in transmission of pain, particularly in primary sensory neurons. The invention also describes a vector that contains the VR1 medulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulator or the vector into a cell that contains the VR1 gene. The modulator of the vector into a cell that contains the VR1 gene. The

products of the

invention are used for detecting a transcription factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   from its binding to a regulatory sequence (or a double-stranded oligonucleotide fragment of it), e.g. by Western blotting or enzymelinked immunosorbant assay particularly for diagnosis of diseases associated with overrexpression or underexpression of the transcription factor. The region that modulates VR1 receptor expression includes a binding site for a transcription factor, e.g. MZF1, NFkappaB, NFAT or GATA1. The nucleic acids of the invention, or vectors containing them, are used for prevention or treatment of pain, also for treating sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and mysalgia, that are associated with activity of the VR1 receptor. This sequence represents a fragment of human VR1 exon 1d DNA which is capable of binding to a transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipaoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot wine stain; Sturge Weber syndrome; ss. kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA171367 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17560 and AAA17625 to AAA17644 represent their corresponding target sequences; AAA17685 to AAA188385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19-JUN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAA22972

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC and AAA19155 to AAA19222 represent their corresponding target sequences;
CC AAA1923 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
CC AAA21596 to AAA21688 represent their corresponding target sequences;
CC AAA21596 to AAA21688 represent their corresponding target sequences;
CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
CC AAA21689 to AAA22475 and AAA23476 to AAA2342 represent ribozyme sequence
CC AAA21622 represent their corresponding target sequences. The ribozyme of
CC the invention are used for modulating the synthesis, expression and/or
CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
CC especially used to treat cancer, diabetic retinopathy, age related
CC macular degeneration (ARMD), inflammation, and arthritis, as well as
CC neovascular glaucoma, myopic degeneration, sporiasis, verruca vulgaris,
CC angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
CC integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

0;

The present invention describes a method (M1) presence or absence of a predetermined endoges sequence (ENAT). The method comprises hybridi

d endogenous hybridising

determining nucleic acid a probe havi

acid ta having

for

or absence of a (ENAT). The meth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       depolymerises the 3' end of hybridised NA to release the INS. MI is used for determining the number of known sequence repeats present in a nucleic acid target sequence in a nucleic acid sample. The method is also useful for determining whether a nucleic acid target sequence in a sample is an allele from a homozygous or heterozygous locus. The method is also useful for detection of mutations, translocations and SNPs in nucleic acids (including those associated with genetic disease) determination of viral load, species identification, sample contamination, and analysis of forensic samples. AAA86791 to AAA87079 and AAB12817 represent sequence which are used in the exemplification of the present invention. N.B. There is a discrepancy between the SEQ ID NO: and sequences given in the examples, and the SEQ ID NO: and sequence listing
                                                                                                                                                                                                                                                                                                                                                                                             New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EP1281758-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human MDZ7 scanning oligonucleotide SEQ ID 5298.

0;

proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome fsp11.3 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic

proteins are also useful

for diagnosing

유

monitoring a

disease

The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                              or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
                                                                   useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                         proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New zinc finger-containing proteins and nucleic acids, useful manufacturing a medicament for treating or preventing a disord associated with decreased or increased expression or activity MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; immunostimulant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human MDZ7 scanning oligonucleotide SEQ ID

                                                                                                                                                                                                                              proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ4, MDZ7, or MDZ12, genetic locus. The probes are material discovery and characterize gross are monitoring microscore and characterize gross are monitoring microscore across a manufacture of the manufacture of the probes are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2003-423107/40.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADB04285 standard;
                                                                                                                                                                           useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                              Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel human zinc finger-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 8; SEQ ID NO 5271; 103pp; English.

                                                                                                                                                                                                                                                                                                 The invention relates to a novel short interfering RNA (giRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66553 represent substrate/target sequences for the human ribox.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ribozyme; short interfering enzymatic nucleic acid; H-Ras; N-Ra anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29-MAY-2001; 2001US-0294140P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59389 - ABZ6216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, according to the human of the first of the formal substrate/target sequences for the human in the control of the first of the substrate acids according to the human of the first of the substrate acids according to the human of the first of the substrate acids according to the human of the first of the first of the human of the first of the first of the first of the human of the first of the first
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti) sense reagents, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a method of determining presence or absence of a CC desired nucleic acid (NA) that contains multiple repeats of a CC predetermined NA target sequence in a NA sample. The method involves convoiding a treated sample that may contain the desired NA in which composed the predetermined repeating NA target sequences are hybridised with a CC several predetermined repeating NA target sequences are hybridised with a CC NA probe, analysing for presence of hybridised NA containing the NA CC probe, and thereby the presence or absence of the desired NA. The method CC is useful for determining the presence or absence of desired nucleic acids that contain multiple repeats of a predetermined NA target CC acids that contain multiple repeats of a predetermined NA target the compositive in length and/or sequence. The methods can be efficiently used for CC distinguishing human and bacterial NA. The method is highly sensitive, CC and enables detection and quantification of the presence of a NA without CC the need to undergo a NA target sequence enrichment step prior to a NA CC hybrid detection step. The method enables rapid and accurate detection of CC a desired NA that contains multiple repeats of a NA target sequence. This cCC sequence represents a probe used to detect the human Alu repeat sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

#3446

schizophrenia;

88;

The invention relates to fragments of at least 15 Disclosure; Page 434;

the isolation of 6327 nucleotide sequences, consecutive nucleotides of these nucleotides,

in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or

New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides, and transfected cells.

The nucleotides (also vectors containing them and c eals containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment c viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

CC analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can c also be used to screen for their specific interactive molecules, c potentially useful for treating diseases associated with abnormal c expression of the nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 몺

The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Allzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention.
